

LAKESIDE MEDICAL CENTER - Hospital Medicine
Patient Discharge Summary & Instructions

Name: Daniel Reyes DOB: 1958 (age 67) Encounter: TEST-7782
Admit date: 10/11 Discharge date: 10/15
Discharging physician: Dr. A. Patel

DIAGNOSIS

Community-acquired pneumonia (infection in the right lung). Also known: type 2 diabetes, high blood pressure.

HOSPITAL COURSE (brief)

Treated with IV antibiotics for 3 days, then switched to pills. Oxygen was needed on days 1-2 and is no longer needed. Fever resolved on 10/13.

MEDICATION LIST AT DISCHARGE

- * Amoxicillin-clavulanate (Augmentin) 875/125 mg: 1 tablet by mouth twice a day with meals for 4 more days (last dose on the evening of 10/19). Finish ALL tablets even if you feel better.
- * Prednisone taper: 40 mg daily for 2 days, then 20 mg daily for 2 days, then stop.
Take in the morning with food. Prednisone can raise blood sugar.
- * Guaifenesin 600 mg: 1 tablet every 12 hours as needed for cough/chest congestion.
- * Metformin 1000 mg: continue 1 tablet twice daily with meals. (Was held in hospital, OK to resume tonight.)
- * Lisinopril 20 mg: continue once daily.
- * Albuterol inhaler: 2 puffs every 4-6 hours only if wheezing or short of breath.

Do NOT take: over-the-counter cough suppressants containing codeine.

Because you take prednisone, check your blood sugar at least twice daily (before breakfast and before dinner) until the prednisone is finished. Call your doctor if readings are above 300.

Follow-up appointments

- Primary care, Dr. Singh - in 5 to 7 days.
- Chest X-ray - in 6 weeks to confirm the pneumonia has cleared.

Activity: Rest at home for several days. Return to normal activity slowly. Drink plenty of fluids unless told otherwise. Do not smoke and avoid smoke exposure.

Return to the Emergency Department or call 911 for: trouble breathing, chest pain, confusion, lips or fingertips turning blue, or a fever above 101 F that lasts more than 48 hours.
Call your doctor for: worsening cough, vomiting that keeps you from taking your pills, rash or severe diarrhea (possible antibiotic reaction).
